

When we conduct work on projects:

Create a folder Context folder, in the folder you're working in, and then create a context file, Claude. As you work, update the file.

If the context file gets huge (>5K words):

Move details to separate .md docs. Reference them in the main context. Keep the main context concise.

On every new session:

Start fresh, don't include conversation history. Refer to Claude.md in every session.

- Scan your directory
- Reads your files
- Asks clarifying questions
- Automatically generate context from a file
- Enable me so I don't have to give context for you to know what's going on.

✓ WHAT TO INCLUDE:

- Project overview
- Current phase/status
- Key files and their purpose
- Major decisions made
- Next steps

- Links to reference documents

✗ DON'T include:

- Full project content (just reference files)
- Conversation history (build this naturally)
- Temporary notes (keep focused)

Context file enables:

📁 Clean context file

✓ Auto-loads on launch

📁 One project folder

🔗 Direct file access

📄 Good source to update myself

Anatomy of a Context File

Example Claude.md:

1. Project: Football information portal
2. Overview
3. Current Phase
4. Key Files
5. Decisions Made
 - Focus on the engine

- Avoid super technical details
- Include recommendations
- 6. Next Steps
 - Complete part-1.md draft
 - Get feedback on the app's current standing
 - Recommendations list
- 7. Reference Documents
- 8. Consider:

Context File Best Practices

✓ DO

- Update regularly - After major work sessions
- Be concise - Don't dump the entire project
- Reference files - Don't duplicate content
- Track decisions - Why you chose something matters
- Sync across tools - If using multiple AIs
- Version control - Commit to git

✗ DON'T

- Include sensitive data - Context files are readable
- Copy/paste everything - Reference instead
- Let it get stale - Update as the project evolves
- Over-explain - AI is smart, be concise
- Forget to sync - When using multiple tools
